## Description

The LXT-81U-D transducer converts temperature from an input sensor to the output signal 0...5mA, 0...20mA, 4...20mA, 0...5V or 0...10V with galvanic separation between an input sensor and the output. A device assures cold junction compensation (if thermocouple is connected as input signal) or it makes input wire resistance compensation (if resistive element is connected). Each output signal may be inverted. Front jumpers allow for easy and comfortable setting all parameters like sensor, operating range, compensation, output signal and sensor break signalization. There is possibility to deliver device for non-standard signals on demand.
