- Multifunction time relays (7 time functions; 8 time ranges)
- Cadmium - free contacts •AC/DC input voltages
- Cover - installation module, width $17,5 \mathrm{~mm}$
- Direct mounting on 35 mm rail mount acc. to PN-EN 60715
- Application: in low-voltage systems
- Compliance with standard PN-EN 61812-1
- Recognitions, certifications, directives:

(1) The control terminal S is activated by connection to A 1 terminal via the external control contact S . (2) Where the control signal is recognizable. (3) Length with 35 mm rail taps: $98,8 \mathrm{~mm}$. (4) For first range setpoint (1 s) setting accuracy and repeatability are smaller than the given ones in technical parameters (significant influence of the operational relay operating time, processor start-time, and the moment of supply switching as referred to the AC supply course). (6 Calculated from the final range values, for the setting direction from minimum to maximum.

## Time functions

Permanent switching ON and OFF.
The functions ON and OFF are selected with TIME potentiometer. In the ON function, the normally open contacts are closed all the time whereas in the OFF function they are open. The position of the FUNC potentiometer is of no significance in these functions as is the preset measurement time. The ON or OFF functions are used for the time relay operation control in electric systems.

## E - ON delay.

On applying the supply voltage $U$ the set interval $T$ begins - off-delay of the output relay $R$. After the interval $T$ has lapsed, the output relay $R$ switches on and remains on until supply voltage $U$ is interrupted.

Wu-ON for the set interval.

Applying the supply voltage $U$ immediately switches the output relay $R$ on for the set interval T. After the interval T has lapsed, the output relay $R$ switches off.

Bp - Symmetrical cyclical operation pause first.

Applying the supply voltage $U$ starts the cyclical operation from the $T$ interval - switching the output relay R off followed by switching on the output relay R for the interval T . The cyclical operation lasts until the supply voltage $U$ is interrupted.

T-Generation of the $0,5 \mathrm{~s}$ pulse after the interval T .

Applying the supply voltage $U$ starts the interval $T$. After the interval $T$ has lapsed, the output relay switches on for $0,5 \mathrm{~s}$ (the time of the NO contact of the output relay).
$\mathbf{R}$ - OFF delay with the control contact S .

The input of the time relay is supplied with voltage $U$ continuously. Closing of the control contact S immediately switches on the output relay $R$. Opening of the control contact $S$ starts the set time of the delayed switching off of the output relay $R$. After the interval $T$ has lapsed, the output relay $R$ switches off. If the control contact $S$ is closed during the interval $T$, the already measured time is reset, and the output relay $R$ is switched on again. The OFF delay of the output relay R will start when the control contact $S$ is opened again.

Ws - Single shot for the set interval triggered by closing of the control contact $S$.

The input of the time relay is supplied with voltage $U$ continuously. Closing of the control contact Simmediately switches the output relay $R$ on for the set interval T. After the interval $T$ has lapsed, the output relay $R$ is switched off. In the course of the interval T, any opening of the control contact $S$ does not affect the function to be performed. The output relay R may be switched on again for the set interval, after the interval T has lapsed, by closing the control contact $S$ again.

Wa - ON for the set interval triggered with the control contact S.

The input of the time relay is supplied with voltage $U$ continuously. Closing of the control contact $S$ does not start the interval T , and it does not change the position of the output relay $R$. Opening of the control contact S immediately switches on the output relay R for the set time. After the interval $T$ has lapsed, the output relay $R$ switches off. Opening and closing of the control contact $S$ in the course of the interval $T$ does not affect the function to be performed. The output relay R may be switched on again for the set interval with another closing and opening of the control contact S.
$\mathbf{U}$ - supply voltage; $\mathbf{R}$ - output state of the relay; S - control contact state; $\mathbf{T}$ - measured time; $\mathbf{t}$ - time axis

## Additional functions

Supply diode: it is lit permanently when the time is not being measured. In course of the T time measurement, it flashes at 500 ms period where it is lit for $80 \%$ of the time, and off for $20 \%$ of the time.

## Adjustment of the set values:

- the values of time and range are read in the course of the relay's operation. The set values may be modified at any moment,
- no change of the function is possible in the course of the relay's operation. Any change of the settings of the relay shall be read only after the supply voltage has been switched off and on again.

Release: depending on the function to be performed, the relay is released with the supply voltage or by connection of the $S$ contact to the A1 line. For DC supply, the positive pole must be connected to the A1 line. The level of the S contact activation is adjusted automatically depending on the supply voltage.

Supply: the relay may be supplied with DC voltage or AC voltage $48 \ldots 63 \mathrm{~Hz}$ of $10,8 \ldots 250 \mathrm{~V}$. A programmed control of the supply voltage has been applied so the processor shall not start operation if the voltage is lower than approximately 10 V . The supply voltage is permanently monitored in course of the operation of the relay. When the voltage drops below 9 V for more than 50 ms , the relay shall be reset. Owing to this, the regeneration time is programmed to 50 ms , and it does not depend on the tolerance of the elements.

## Dimensions

Front panel description

## Connection diagram

(1) The control terminal $S$ is activated by connection to A1 terminal via the external control contact S .

## Mounting

Relays MT-TUA-... are designed for direct mounting on 35 mm rail mount acc. to PN-EN 60715. Operational position - any. Connections: max. cross section of the cables: $1 \times 2,5 \mathrm{~mm}^{2} / 2 \times 1,5 \mathrm{~mm}^{2}(1 \times 14 / 2 \times 16$ AWG), length of the cable deinsulation: $6,5 \mathrm{~mm}$, max. tightening moment for the terminal: $0,6 \mathrm{Nm}$.

## Two taps:

easy assembly on 35 mm rail, firm tapping (top and bottom).

## Ordering codes

Example of ordering code:
MT-TUA-17S-11-9240-7 time relay MT-TUA-..., multifunction (relay perform 7 functions), cover - installation module, width $17,5 \mathrm{~mm}$, one changeover contact, contact material AgNi , rated input voltage $12 \ldots . .240 \mathrm{~V}$ AC/DC AC: $50 / 60 \mathrm{~Hz}$

PRECAUTIONS:

1. Ensure that the parameters of the product described in its specification provide a safety margin for the appropriate operation of the device or system and never use the product in circumstances which exceed the parameters of the product. 2. Never touch any live parts of the device. 3. Ensure that the product has been connected correctly. An incorrect connection may cause malfunction, excessive heating or risk of fire. 4. In case of any risk of any serious material loss or death or injuries of humans or animals, the devices or systems shall be designed so to equip them with double safety system to guarantee their reliable operation.
